## Flow of data

## Nominal

The category labels are not ordered, so it doesn't matter which number comes first.

## Ordinal

In the ordinal scale of data, there is an order. However, the difference between them can not be quantified.

## Data Types

# Measurement Scales

There are four types of measurement scales used in statistics: nominal, ordinal, interval and ratio. Each scale has different properties and uses.

## Interval

In the interval scale, we do have an order (just like ordinal data), and we can find the exact difference between the two values.

## Ratio

The ratio scale has all the features of the Interval scale, and in addition, there is an absolute or true zero as well.

# Multi Dimensional Nature of Data Quality

## Parameters

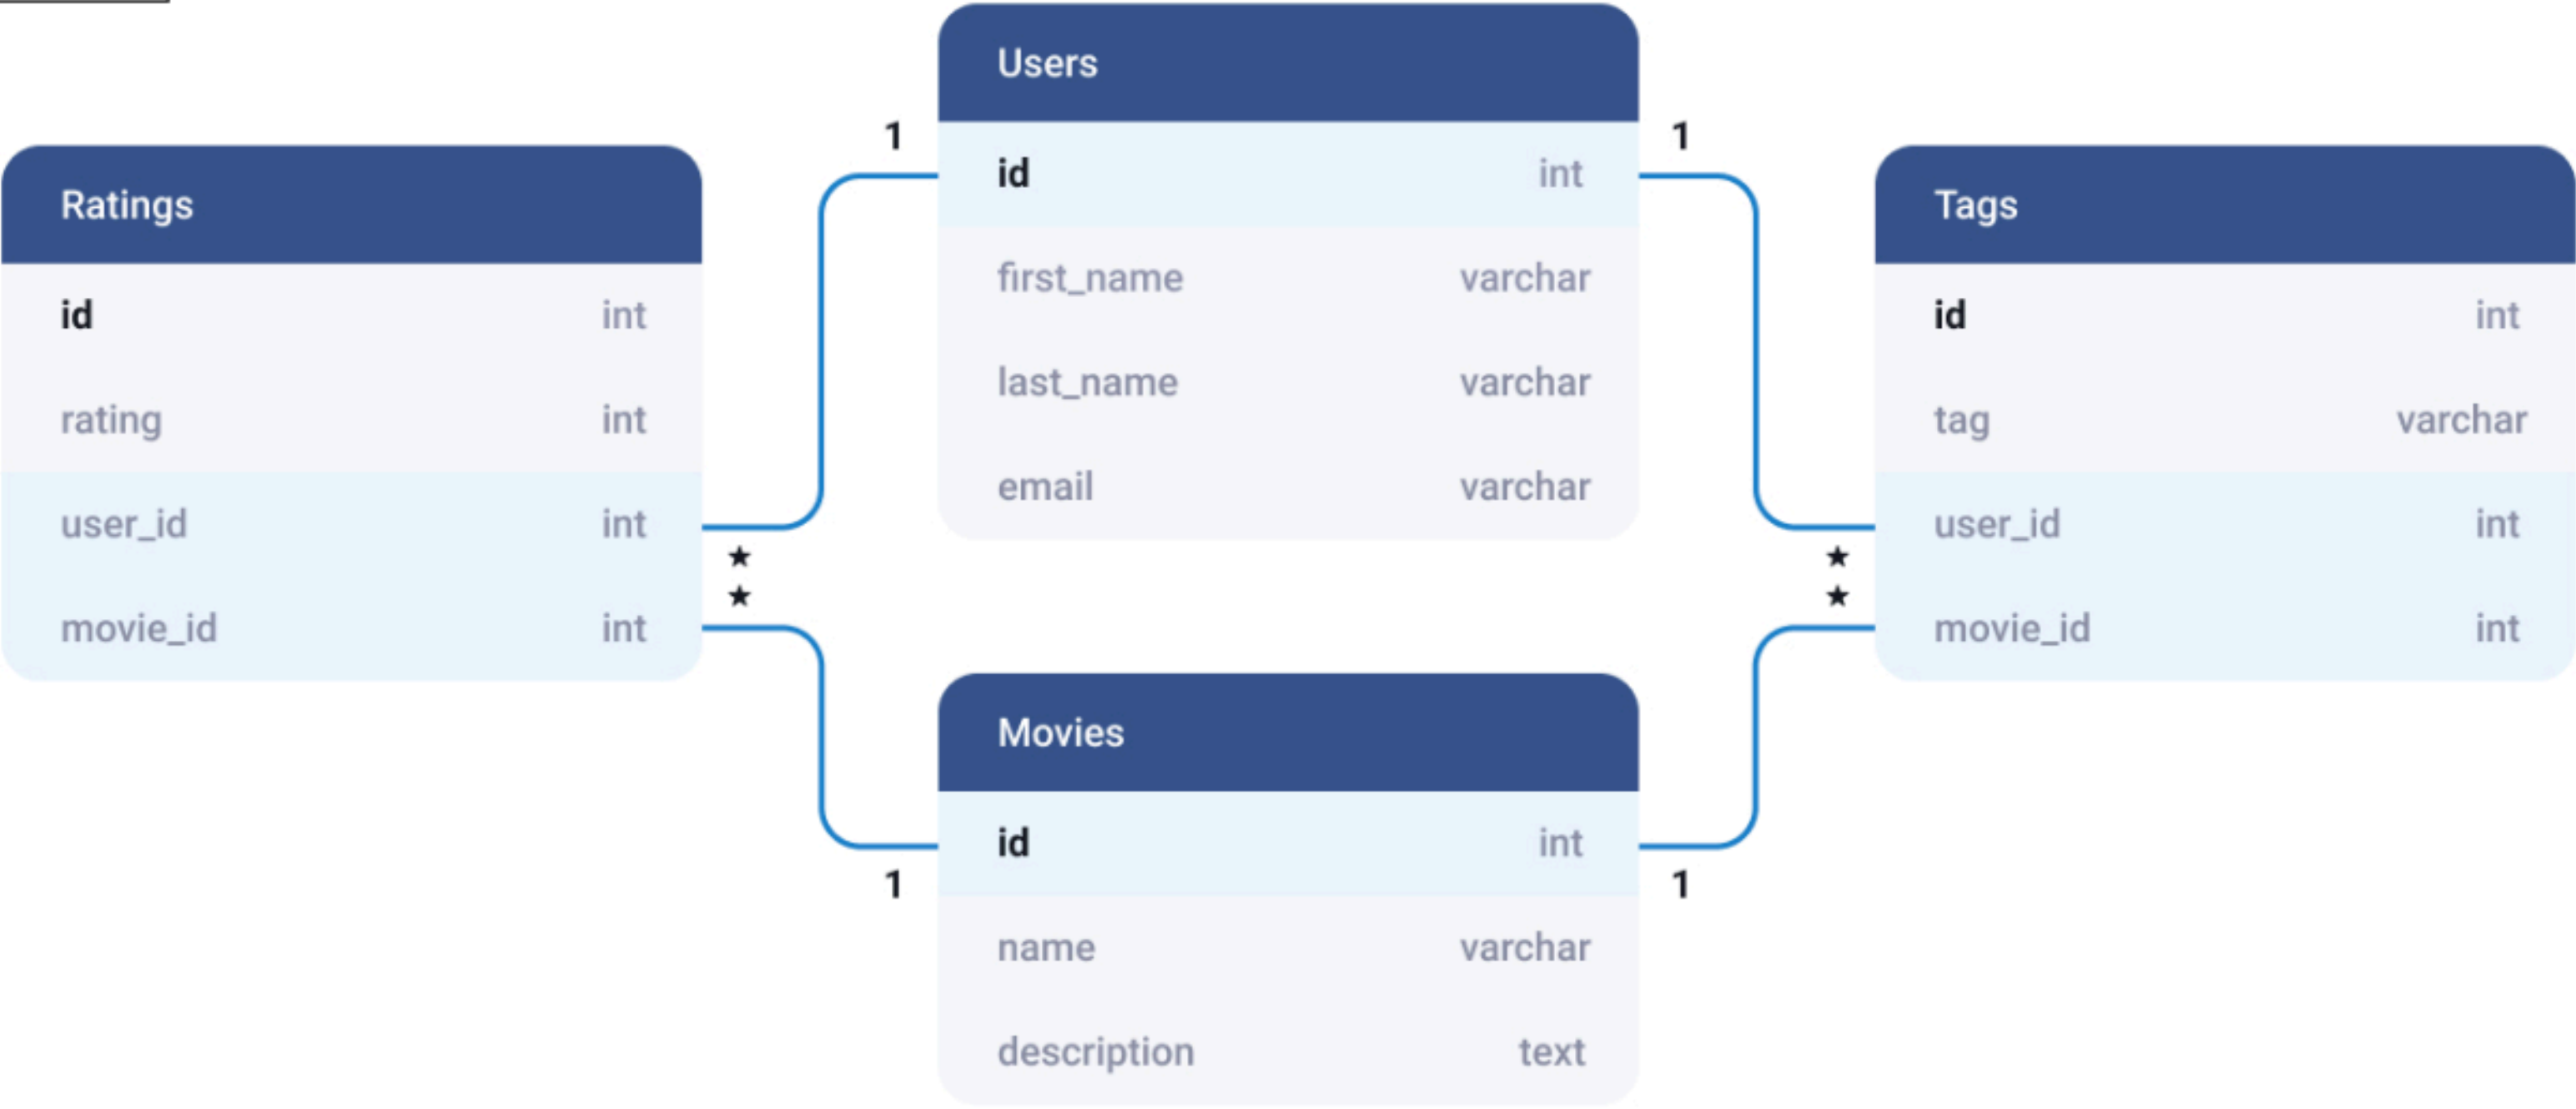

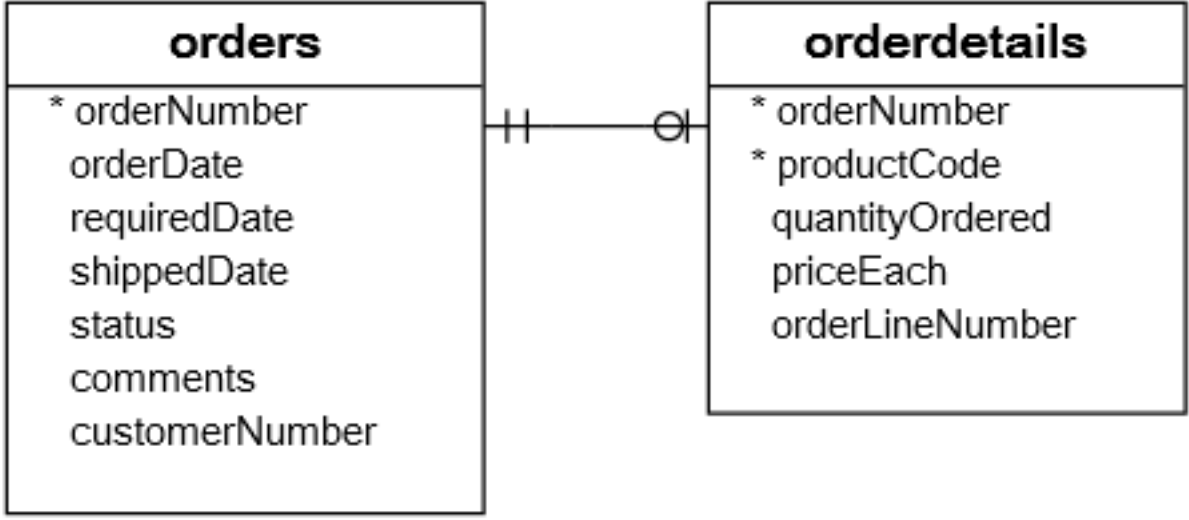

- Accuracy
- Completeness
- Time-Related Dimensions
  - Currency, Timeliness & Volatility
- Consistency
